Dayton, Ohio October 22, 1870

To Prof. C. L. Marsh
Yale College

Dear Sir,

At the request of my young lady friends, Mrs. Davis & Phillips, I have the pleasure to present to you from Yale College, a photograph of my "Bactonodon Ameghisoni" tooth and part of the vertebra of another of the same species, as I had them excavated from near the same locality in the phosphatic beds near Crookston, Minn., I obtaiined over a hundred teeth, but none so large as the one I send to you now. I have one somewhat smaller, but it is entirely perfect and scaled with all of the enamol.
on both sides. I will give you
the front side of it on the other
page. I regret very much that
I am unable to write with a
pen. I had my right hand
seriously injured three months
ago, and have not used any pen
since. The photographs I also
send by mail.

I am truly yours

[Signature]

James Green

Post Office

[Address]

[Diagonal lines drawn on the page]

I also collected a good collection
of the Mammals (Octomuese) from
the same locality.

My Entomology collection is large,
principally from the Potomac.

James Green, 1861

P.S. I am only an amateur Geol-
ologist; but I have a good collec-
tion that I collected myself "in situ"
from all the rocks in the U.S.
This side of the Rocky Mountains.
Goldsmith states that the Should have 6 rows of teeth (42 in each jaw) making 144 in all. If the teeth were all as large as this one the head must have been enormous.

The other side of this card says:
Presented to Yale College by
Col. James Green,
Dayton, Ohio,
1870.
