NYMPHALIS J-ALBUM CAPTURED AT FLUORESCENT LIGHT IN CHICAGO

After reading the note by W. A. ANDERSEN vol.14: page 62 of the *Journal*, I remembered that I too had caught a *Nymphalis j-album* Boisduval & Le Conte at a light. Thus, looking back among my field notes I came upon the following notation: "On the morning (about 9:00) of Aug. 20, 1952 one of the girls that worked in the laboratory where I work came to me in the Animal Room all excited and exclaimed, "Come quickly there is a large moth flying about the lights in the lab." I had visions of perhaps a *Cecropia* or something which had possibly emerged late in the season so went right away to see what it was. The "moth" turned out to be a large nice perfect specimen of *N. j-album* and with some difficulty I managed to capture it by climbing up a stepladder. The butterfly was very active, flying at the fluorescent light in the ceiling of the laboratory. This is the first time I have ever observed *N. j-album* in Chicago."

I might further add that I have not seen any since that time anywhere in the Chicago Area. The specimen now resides in my private collection. I would also like to mention here (this is from memory only) that back in about July 1946 I saw 6 or 7 *Pieris rapæ* L. flying about a street light at night in Le Claire, Iowa.
