FREEMAN COLLECTION OF MEGATHYMIIDAE DONATED TO  
THE AMERICAN MUSEUM OF NATURAL HISTORY

For the past 30 years Mr. H. A. Freeman has concentrated on the Megathymidae. During this period he has worked out the life histories and food plants of most of the species and subspecies in this family, and he has named many of these. His magnificent collection, containing 2353 specimens, nearly all of them reared from the early stages, has been donated to the American Museum of Natural History. It includes nine holotypes, 14 allotypes, one neallotype, and 638 paratypes; 76 genitalic preparations and a large number of pupal cases are also included. All of Freeman's primary types of the Megathymidae, with one exception, are now in the collection of the American Museum of Natural History. This generous donation gives the American Museum one of the largest and most complete collections of this family in existence.

FREDERICK H. RINDGE, *Curator, Department of Entomology, The American Museum of Natural History, New York, New York 10024*
