

butterflies, while feeding, remained quite motionless with wings tightly closed. They seemed quite unwary and were easily approached, which is not the usual case with this species in heavily wooded areas.

Additional specimens of *O. jutta reducta* were taken on yellow flowers along a dirt road in Albany Co., Wyoming on 1 August, 1969. They were found at the edge of a very dry lodgepole pine stand.

Other specimens collected during 1969 in Sublette, Fremont, and Sheridan Cos., Wyoming were found in rather heavily wooded areas flying about rocks and deadfall as described in Brown's book.

From these observations, it must be concluded that *O. jutta reducta* does feed upon flowers in some instances. Both sexes were involved. Flower feeding was observed during the hours from 11:00 AM to 2:00 PM (MDT).

BOOK REVIEW

ANNOTATIONES RHOPALOCEROLOGICAE 1970—Charles F. Cowan, Clunbury Press, Berkhamsted, Herts, England, 70 pp., 15 April 1970. \$3.00 US.

“This is the second and final instalment of an addenda and corrigenda to the late Francis Hemming's ‘Generic Names of the Butterflies and their Type-Species’ . . .” is the opening sentence of this most interesting booklet. Col. Cowan's two contributions to the stability of nomenclature must be studied by every nomenclator and every active taxonomist. Here is a synopsis of the current part:

A. An addenda of generic names published before 1965 and omitted from Hemming's work. Thirty-two names, including eleven for American Lycaenidae by Clench and *Poladryas* Bauer, are discussed. Seventy names omitted from the index of Hemming's book are listed.

B. Comments on dates of publication of works by 17 authors, including several written by S. H. Scudder.

C. Comments on the changes made in 1964 relative to Articles 11 and 31 of the International Code. These affect forty names including several genera appearing in the Americas.

D. Comments on several cases pending before the I.C.Z.N. involving butterfly genera.

E. An analysis of emended names for genera and comment upon the justification or lack of justification for each case. Several of the forty-seven names touched upon apply to American butterflies.

F. This particular section is an index to all names commented upon by Cowan. The alphabetic list of emendations to be made to Hemming's “Generic Names . . .” is extremely useful.

G. Here are listed alphabetically: incorrect subsequent spellings and unjustified emendations, unadopted synonyms, and ghost names.

Copies of this valuable little booklet may be purchased from the author at Little Gaddesden House, Berkhamsted, Herts, England.
