Hardwick & J. E. H. Martin, 4 & &, 5 &, 9 &.

In addition to the above there is a short series in my collection from Robson, B. C., collected by N. R. Foxlee on 23–26 May in 1936 and 1937. Except for these it might be assumed that the subspecies is confined to the Okanagan Valley in British Columbia. The distributional data for such an assumption probably is in artifact of collecting. Very definitely there is a lack of material from both east and west of the Okanagan Valley in the Canadian National Collection. When that is remedied we will have a better idea of the range of *piasus* in Canada.

A RECORD OF EUPHYDRYAS ANICIA (NYMPHALIDAE) IN OKLAHOMA

In June 1959, I took a male of *Euphydryas anicia* Doubleday at Lawton, Comanche Co., Oklahoma near Fort Sill, a major artillery training base for the Army. It seems possible that a pupa or a number of pupae were brought to Fort Sill in some plants a soldier brought with him or in a shipment of goods to the base. This seems the only plausible explanation of *anicia's* presence in Oklahoma, hundreds of miles from it's nearest recorded range.

I have collected in Lawton for eight seasons since 1959, mostly in June, and have never seen another specimen. This is the first record of the species from east of the hundredth meridian in Oklahoma that I have knowledge of.

The author would like to thank Mr. F. M. Brown, Fountain Valley School, Colorado Springs, Colorado, for reading the manuscript and offering his suggestions.
