

## FEATURE PHOTO

Unusual moth pupa, *Gonionota* sp. (Oecophoridae), from Ecuador. It is covered with blunt projections and two lateral flanges, and is shown in dorsal view. It measures 10 mm high by 6 mm maximum width and was found upright and exposed on a leaf surface. It probably mimics an inedible object. Other *Gonionota* spp. (J. A. Powell 1973, Smith. Contr. Zool. 120, 302 pp.) and *Hypertropha* (I. F. B. Common 1980, Entomol. Scand. 11:17-31) share a similar mode of pupation. Photo taken with a Minolta X-570 and 80 PX ring flash on a 50 mm macrolens. Pupa collected in Ecuador, Pichincha Prov., Hotel Tinalandia, during the period 5-15 May 1988 by S. Passoa, on an undetermined shrub; adult emerged 19 May 1988.
