

OFFICE OF
E. M. TURNER, M. D.,
PHYSICIAN AND SURGEON.

Norton, Kansas, Nov. 7th 1883

Prof. Marsh.

Gale College.

Dear Sir:

I wrote to you a few days ago and now send a photograph of a set of bones teeth &c which were taken by myself and Dr. Turner from one excavation in this county in a formation which I venture to think is Miocene. The tusk I have already described to you — you will now have a better idea of it. The teeth numbered 1. 2. 3 are in a piece of jaw which is protected on the inner side by plaster of paris. Those numbered 4 & 5 were found about 18ⁱⁿ or 2^{ft} from the jaw. The tin type is another view of the same five teeth. The tooth No. 6 is in another fragment of jaw and is altogether different and you will receive also a drawing of a jaw of the same kind with a full complement of teeth except the incisors which are missing. The jaw was obtained in the same excavation about five feet away. There were also ribs of various sizes and numerous foot bones which when cleared we shall try to arrange. The bone at the North east corner of the photo. appears to be a part of a skull but it was not well in focus. The teeth 7. 8. are from other localities. If you can help me to name any of these I shall be greatly obliged

and remain

Yours gratefully
Robert Hay

P.S. my home address is
Box 162 Junction City Kansas
