

1360
Jackport March 3^d 1868

Prof Marsh

Dear Sir

Some of the 13 was
dully red. And in reply to
your questions I have to say
that I have found some
Stylatites near Miter's
of Jackport. that is as far
as the Clinton appears as a
surface rock. between the
upper and lower terraces.

Every stone ball on the
Crapsy farm contains the
and also the Poor House farm
And I have seen them on the
road Daniel Pomroy in Cambridge
Beyond them the Meters

136
the surface rocks
and the Clinton never seldom
appears.

Prof Hall says that the
surface rocks over this whole
region is the Medina. But
he is mistaken for the larger
portion is covered by the
Clinton. That is the region
between the upper and lower terrace.

I have not been an opportunity
to observe the rocks at
or near Pekin and of course
have not a very favorable
opportunity at present when
the snow is three feet deep
on a level and the thermometer
below zero.

I have not seen
that lamination on any
point near Jewston except
where you saw it on the R.R.
But I have no doubt that

136
It extends through to the river
for wherever that formation appears
it is in the dome zone and of the
same thickness. When warm
weather comes I may have an
opportunity to descend the list
further west and get more
low.

By the way I found a few
lines at the Sulphur Springs a Col-
umbian structure in the upper Mi-
ocene just as it disappears
under the salt groups. Which some-
what disturbs my belief in low
age of those lamination formations.
It more resembles Corn in line
than it does low dytates
but I am not sure. I saw
not describe it to you now
but will at some future time
And did you know that
we have at the Sulphur
Springs. A beautiful

Sackett Post ^{May} 4th / 68

Prof Marsh

Dear sir

Since I wrote
You. I have had an
opportunity of Examining
the rocks West of us

On Towns and ^{found}
Your *Alysiatulus* in abund-
ance and in the same
zone that You find them
in Cadis quarry in
Sackett Post.

The first strata - two
feet from the surface
seemed to be continuous
From the Towns and from

5
Which is 13 miles from
Lockport we traced the
same Columnar formation
for three miles west -
Found several columns
capped with shells

Four feet from the surface
found the same formation
and at 12 feet the same
but the strata seemed
irregular & interrupted

So you see that the
same formation extends
& continues from
Lockport to the river
beyond a doubt

Has nothing new
for you. - hope to hear
from you soon or see
you here

Yours truly
A. M. Leonard
