Dear Sir:

This Society has in its cabinet a fossilized penis with the prostate gland attached. It is of the ordinary size, with the head exposed as if circumcised, and I think of limestone formation.

I desire to ask if your Institution has any such specimen in its collection, and if such are rare? Ours is a perfect specimen and undoubtedly genuine. Was found in a gravel pit amongst other human bones.

Hoping to hear from you, I remain

Very truly Yours

(Sgd.) M. S. Pixley M.D.
